

APPLICATION FLOW

Every Path Through the App

Navigation, onboarding, and the core user journeys from first launch to daily use.

TABLE OF CONTENTS

What's Inside

01 Navigation Map

The application shell and its five primary destinations.

02 Onboarding Flow

First-run setup from welcome screen to a ready dashboard.

03 Vision Meal Logging

The primary daily journey, photo to confirmed entry.

04 Quick Lookup Logging

The zero-latency path for simple, known items.

05 Pantry Recipe Generation

From available ingredients to a cook-ready recipe.

06 Progress Review & Export

Reviewing trends and taking data out of the app.

07 Edge Cases & Error Flows

What the user sees when something doesn't go to plan.

08 Screen Transition Map

Every trigger and the screen it leads to, in one table.

01 — SHELL

Navigation Map

AuraFit AI uses a persistent left navigation rail with five destinations. The rail never changes shape — no nested navigation — keeping the whole app reachable in a single click from anywhere.

02 — FIRST RUN

Onboarding Flow

- 1 Welcome & Privacy Promise**

One screen stating the local-only architecture plainly, with a link to the Privacy & Data page. No account creation step exists anywhere in the app.
- 2 System Check**

Detects whether Ollama is installed and running. If missing, offers a guided install link and a "skip for now" option that disables AI features but not the app.
- 3 Biometrics**

Age, sex, height, weight, activity level. Live BMI/BMR/TDEE preview updates as fields are filled.
- 4 Goal Selection**

Aggressive Fat Loss, Lean Bulk, Recomposition, or Maintenance — each shows its resulting calorie delta and macro split live before confirming.
- 5 Dietary Guardrails**

Multi-select diet pattern(s) and allergy exclusions. Conflicting combinations surface an inline warning, not a blocking error.

6

Model Setup (if needed)

If Ollama is present but required models aren't pulled, a progress screen runs `ollama pull llama3.2-vision` and `qwen2.5` with live download status.

7

Ready → Dashboard

Targets are written to SQLite; user lands on an empty-state Dashboard with a highlighted "Log your first meal" call to action.

03 — PRIMARY JOURNEY

Vision Meal Logging

- 1 Entry Point**

User clicks "Log Meal" from the rail or the Dashboard quick-action, lands on the Vision tab by default.
- 2 Capture**

Drags a photo onto the drop zone, or clicks "Use Webcam" to snap a frame directly.
- 3 Analyzing (inline shimmer)**

Image is sent to the local vision model; a shimmer state replaces the drop zone — no separate loading page.
- 4 Verification Table**

Itemized rows appear with editable grams/macros and a per-item confidence badge; a running calorie total updates live.
- 5 Confirm & Save**

User taps "Add to Log." Entry commits to SQLite, Dashboard macro rings update, and a toast confirms the save.

Branch — Low Confidence Item

Rows flagged "low confidence" are visually highlighted amber and pre-focused for edit; saving is never blocked, only nudged.

Branch — Schema Validation Failure

After one silent re-prompt fails, the table opens pre-populated but empty, inviting fully manual entry instead of a dead end.

04 — FAST PATH

Quick Lookup Logging

- 1 Switch to Lookup Tab**

From Log Meal, user switches to the "Quick Lookup" tab — a single search field.
- 2 Instant Search**

Every keystroke queries the local, indexed USDA table; results appear in under 5ms with no network or LLM involvement.
- 3 Select & Adjust Quantity**

Picking a result opens a compact quantity/unit stepper with live macro recalculation.

4

Add to Log

Commits directly — no verification step required, since the data source is authoritative USDA reference data, not a model estimate.

05 — COOKING

Pantry Recipe Generation

- 1 Add Pantry Items**

User types or picks from recent ingredients into a chip input on the Recipes screen.
- 2 Set Constraints**

Active dietary guardrails from Settings are pre-applied automatically; user can optionally set a target prep time.
- 3 Generate**

Local text LLM (llama3.2 / qwen2.5) produces 2–3 recipe candidates scored against the user's remaining macro budget for the day.
- 4 Review Cards**

Each candidate shows a macro-fit bar, prep time, and ingredient list before the user opens full instructions.
- 5 Cook Mode**

Full-screen, step-by-step view with large text and a built-in prep timer; optionally logs the finished meal directly to today's log.

06 — REFLECTION

Progress Review & Export

- 1 Open Progress Tab**

Defaults to the Weight view: current trend line, 7-day average, and a projected goal-completion date.
- 2 Switch Views**

Tabs for Macro Compliance (daily adherence heatmap) and Logging Streak (consistency, not just outcome).
- 3 Export**

From Settings → Privacy & Data, a single "Export All Data" action writes CSV and JSON files to a user-chosen folder — no partial or paywalled export tiers.

07 — RESILIENCE

Edge Cases & Error Flows

Trigger	What the User Sees
Ollama daemon offline mid-session	Vision/Recipe tabs show a persistent inline banner: "AI features paused — Ollama isn't running," with a retry button; Quick Lookup logging is unaffected.
Meal logged pushes macros over target	The relevant macro ring shifts to the "Over Budget" color; no blocking dialog, no shaming language.
User deletes the only logged meal of the day	Dashboard reverts to the empty-state card with the "Log your first meal today" prompt.
Weight entry breaks physiological plausibility (e.g. 40kg swing)	Soft confirmation dialog — "That's a big change since your last entry, save anyway?" — never a hard block.
Export destination folder unwritable	Inline error naming the exact path issue, with a "Choose a different folder" retry.

08 — REFERENCE

Screen Transition Map

From	Trigger	To
Dashboard	Click "Log Meal"	Log Meal → Vision tab
Log Meal (Vision)	Drop/capture photo	Verification Table (inline)
Verification Table	Confirm & Save	Dashboard (rings updated)
Log Meal	Switch tab	Quick Lookup
Quick Lookup	Select result → Add	Dashboard (rings updated)
Recipes	Generate	Recipe candidate list
Recipe candidate	Open	Cook Mode
Cook Mode	"Log this meal"	Dashboard (rings updated)
Any screen	Click nav rail icon	Corresponding top-level screen
Settings	"Export All Data"	OS folder picker → confirmation toast
